

Foreword

Current Problems in Cardiology wants to join the academic community publishing a special issue on COVID-19. These are the last two manuscripts for the special issue.

One paper will report the issue of coagulation abnormalities and plausible benefits of anticoagulation in COVID-19 patients and the other will tackle the issue about the COVID-19 pandemic and changes national security and health care in the spectrum of cardiovascular disease.

Hope the readership of the Journal will find these manuscripts clinically meaningful in order to review several aspects of the cardiovascular problems associated with COVID-19 infection. I would like to thank the authors for writing their experiences in a short time for this special issue.
